

**Dose conversion coefficients
for photon exposure
of the human eye lens**

Rolf Behrens

Contents

- Introduction
- Geometry
- Results
- W/o Kerma approximation (KA):
pros and cons

Introduction

Protection quantities: Organ dose H_T

- Calculated in human phantoms
→ realistic dose in a person
- Cannot be measured
- Dose limits are fixed

Operational quantities: $H(d)$

- Calculated in hypothetical phantoms
→ estimate of dose in a person
- Can be measured
- Dose limits are supervised

Limits are only kept in case

$$\{H_T/\Phi\}, \text{ e.g. } \{H_{\text{eye}}/\Phi\} < \{H_p(d)/\Phi\}, \{H'(d)/\Phi\}, \{H^*(10)/\Phi\}$$

e.g. $\{H_p(3)/\Phi\}$

→ Reliable values for $\{H_T/\Phi\}$ are required

Conversion coefficients for the eye lens

Dr. Rolf Behrens Physikalisch-Technische Bundesanstalt

Introduction

- ICRP74 (=ICRU57) is under revision
 - New values for electrons are available:
Phys. Med. Biol. 54 (2009) 4069-4087
and Corrigendum: Phys. Med. Biol. 55 (2010) 3937-3945
- ➔ ICRP asked for corresponding values for photons

Contents

- Introduction
- **Geometry**
- Results
- W/o Kerma approximation (KA):
pros and cons

Geometry: Eye

Mathematical model

- small volumes can be modelled
- no problems with finite voxel size

Further details:

PMB 54 (2009) 4069-4087

and Corrigendum:

PMB 55 (2010) 3937-3945

Radiation sensitive part of the lens

Geometry: Body (scattering and absorption)

The Calculation of Dose
from External Photon Exposures
Using Reference Human Phantoms
and Monte Carlo Methods

Part I:
The Male (Adam) and Female (Eva)
Adult Mathematical Phantoms

R. Kramer, M. Zankl,
G. Williams and G. Drexler

Institut für Strahlenschutz

GSF-Bericht S-885
Reprinted January 1986
Reprinted July 1999

Fig.1: Exterior of the sex-specific GSF phantoms
in a 3-dimensional coordinate system

- Shape: ADAM and EVA phantoms as used in ICRP74 and ICRU57
- Size: Mean value of ADAM and EVA phantoms
- Cone for every eye socket cut out of head to represent the nose

Conversion coefficients for the eye lens

Dr. Rolf Behrens

Physikalisch-Technische Bundesanstalt

Geometry: Body (scat. + absorp.)

- Parallel beam; Vacuum; Monoenergetic photons: 5 keV - 10 MeV
- Secondary electrons are transported (w/o kerma approximation) (as usual for revision of ICRP74) → Boundary effects realistic
- Monte Carlo transport simulation: EGSnrc using EGSpp

Conversion coefficients for the eye lens

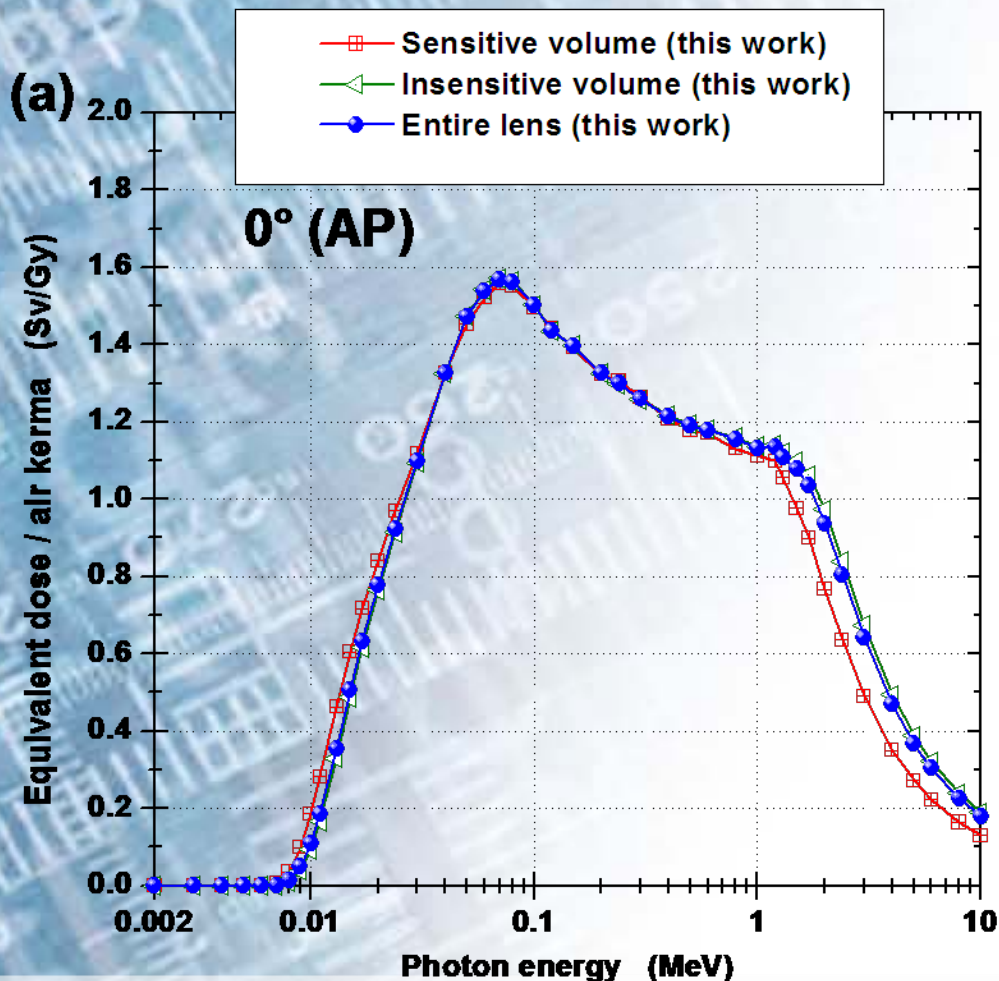

Dr. Rolf Behrens

Physikalisch-Technische Bundesanstalt

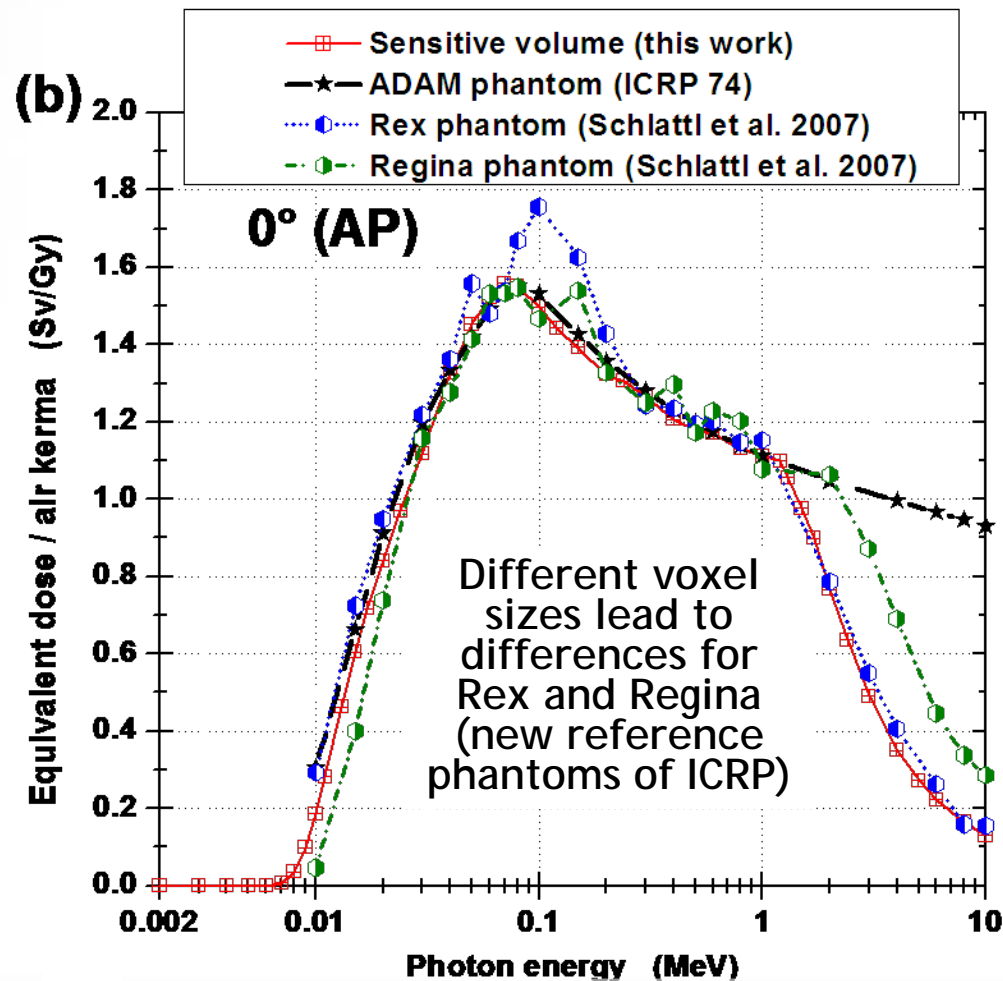

Contents

- Introduction
- Geometry
- **Results**
- W/o Kerma approximation (KA):
pros and cons

Results (mean value of both eyes)

- Less absorption at front part of lens
- Less dose build-up at front part of lens

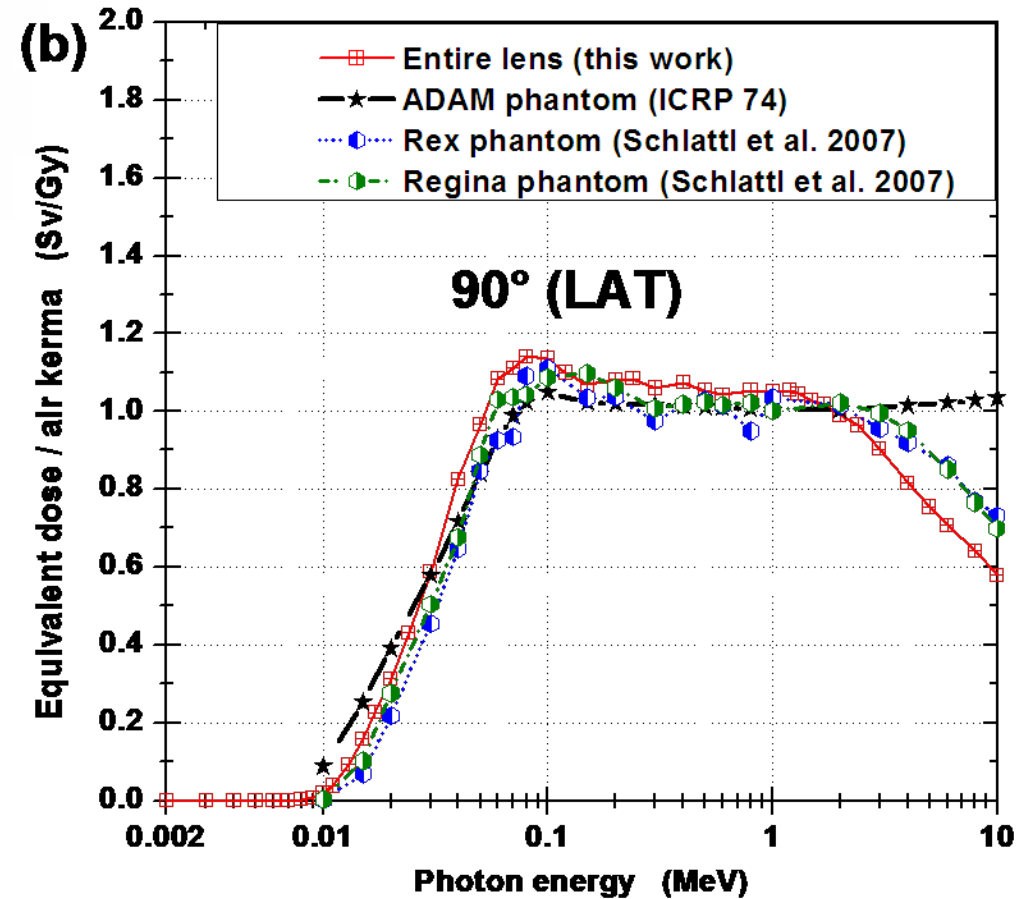

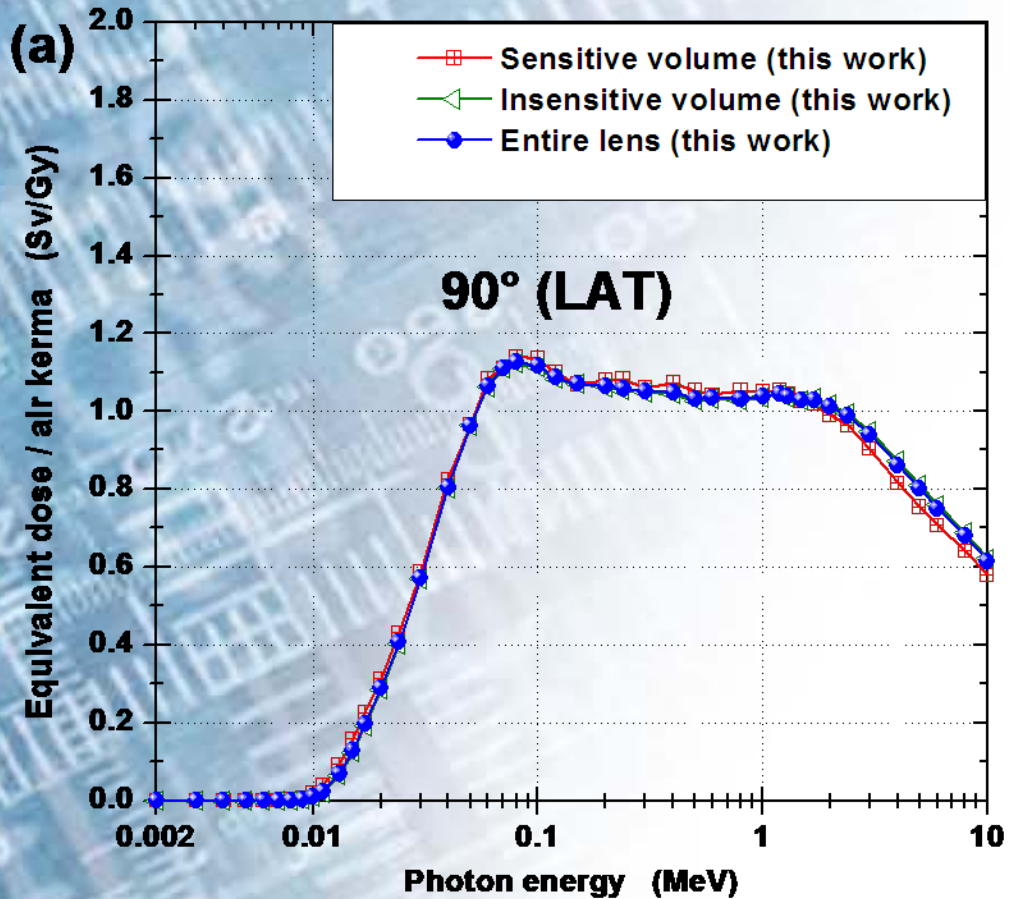

- Dose build-up not calculated in ICRP74 (kerma approximation)

Conversion coefficients for the eye lens

Dr. Rolf Behrens

Physikalisch-Technische Bundesanstalt

Results (mean value of both eyes)

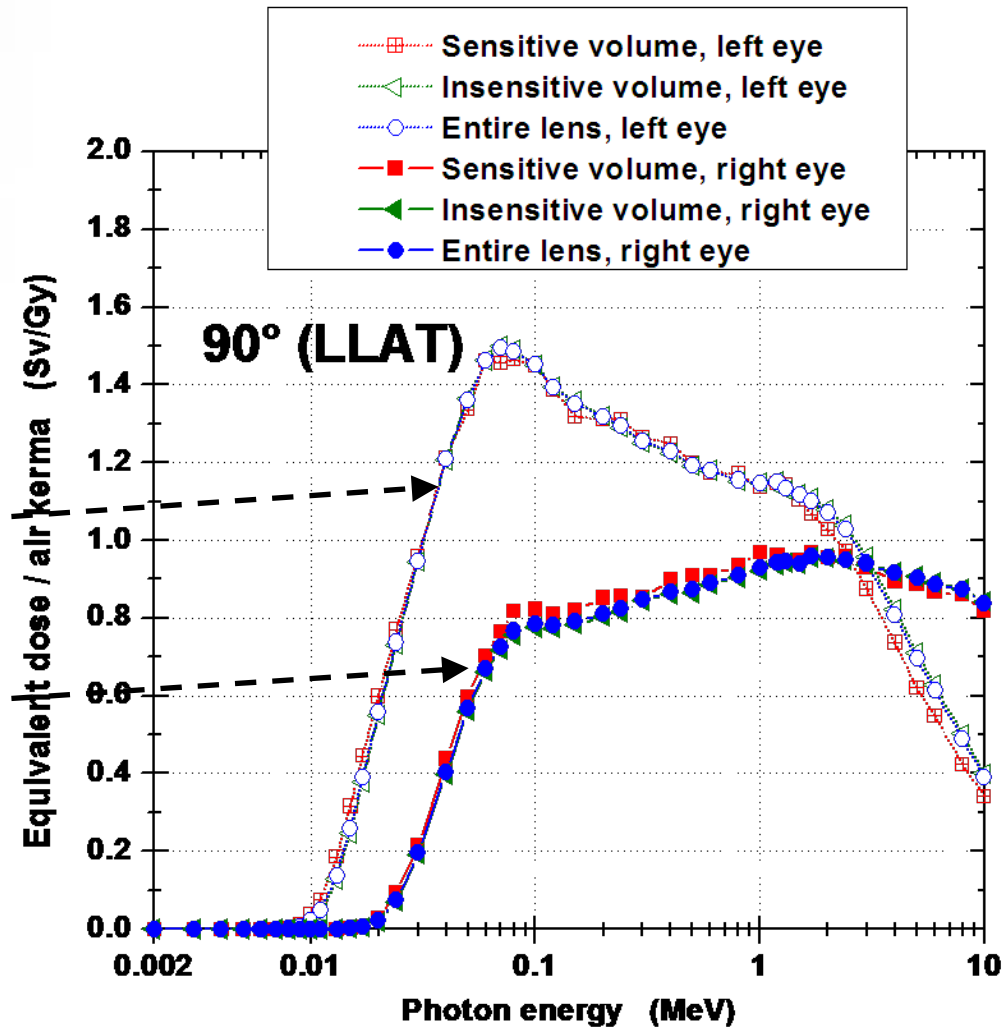

- Absorption in the head

Conversion coefficients for the eye lens

Dr. Rolf Behrens

Physikalisch-Technische Bundesanstalt

Results

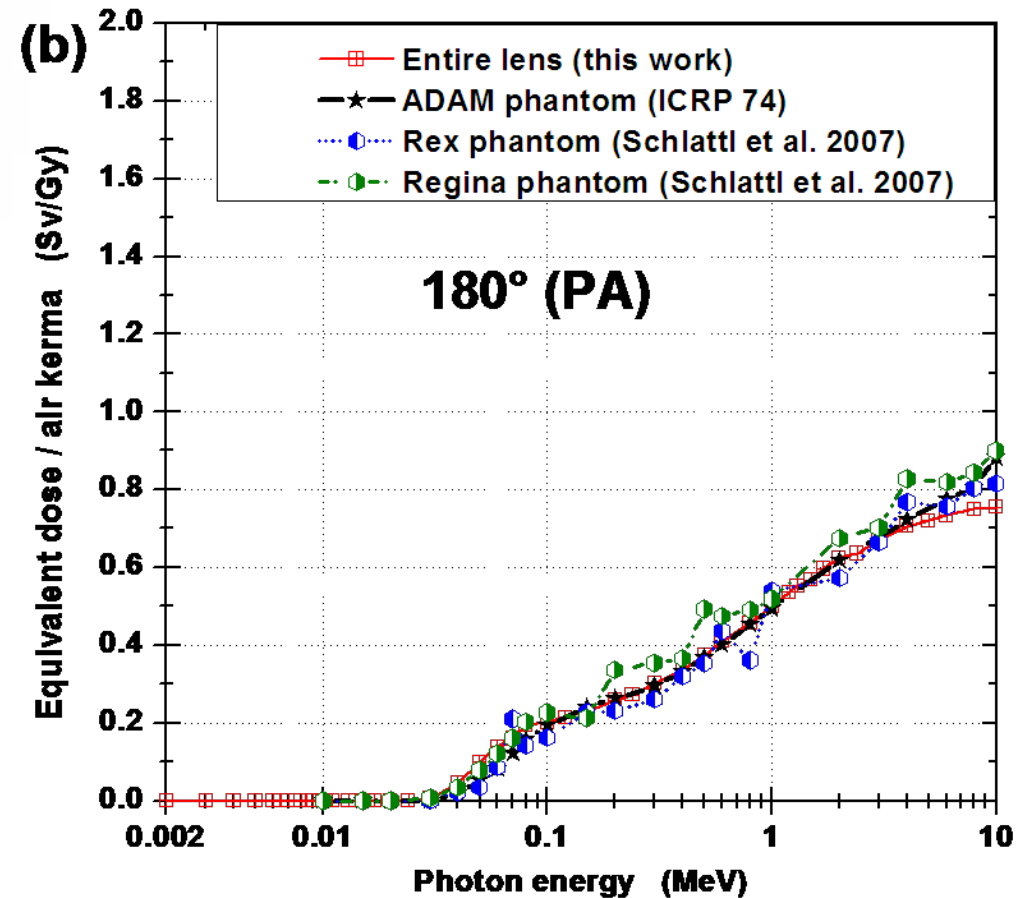

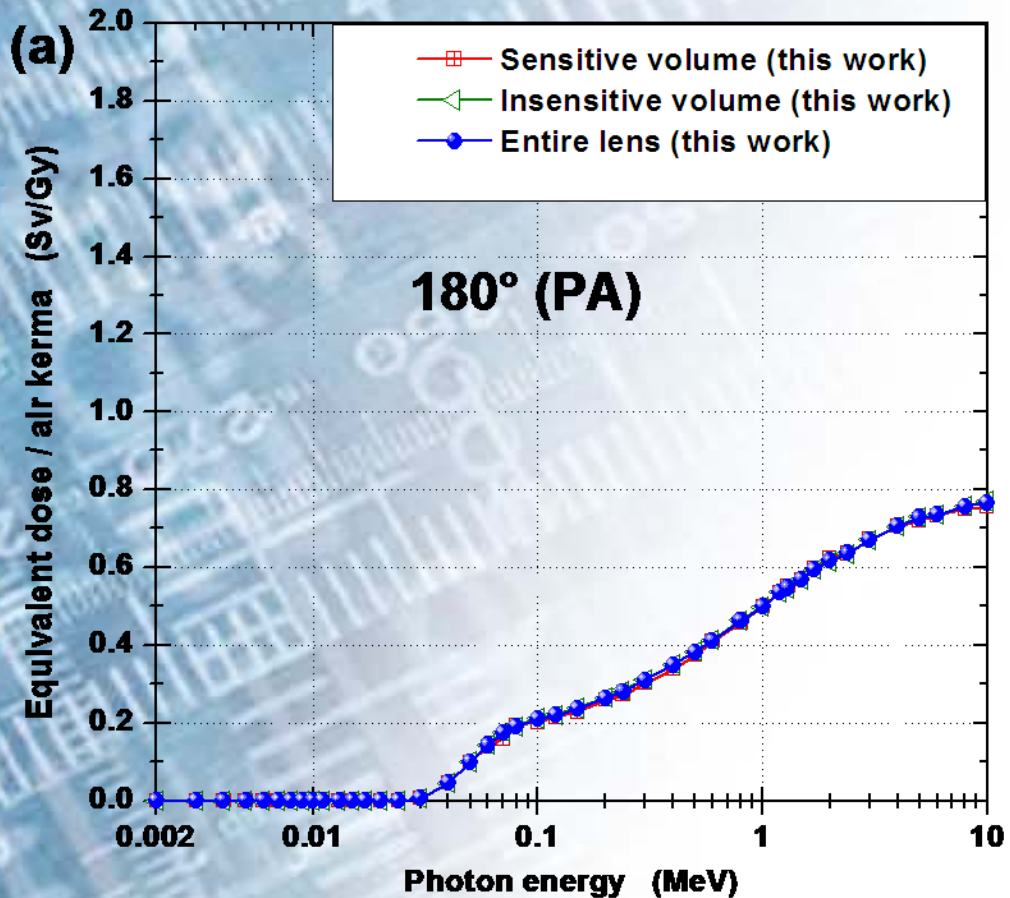

- Absorption in the head: Stronger for the eye opposite the radiation source

Conversion coefficients for the eye lens

Dr. Rolf Behrens

Physikalisch-Technische Bundesanstalt

Results (mean value of both eyes)

- All angles: Similar to values of ICRP 74, except above 1 MeV (kerma approxim.)

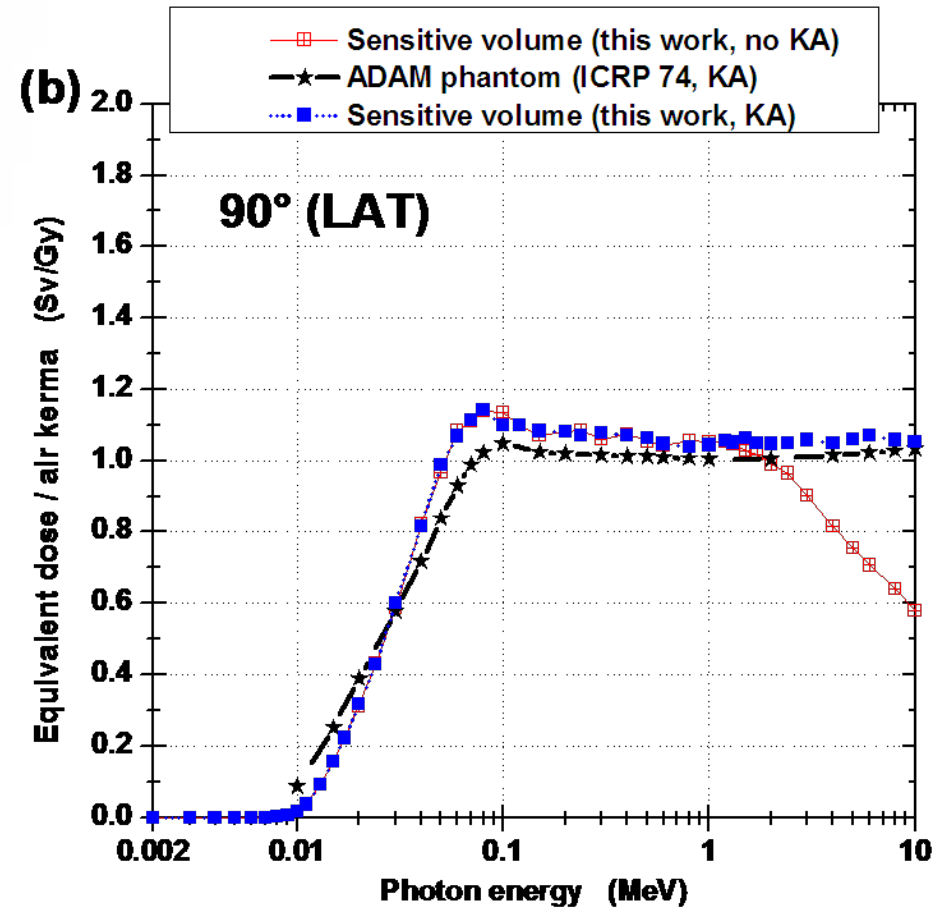

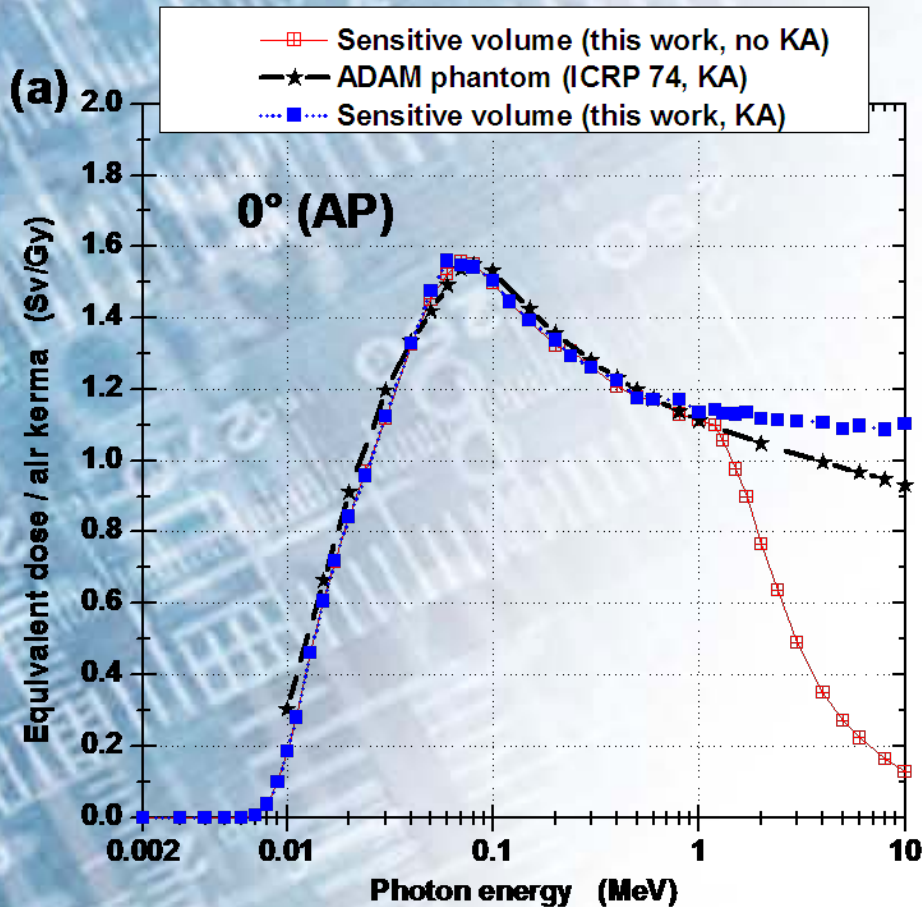

Contents

- Introduction
- Geometry
- Results
- **W/o kerma approximation (KA):
pros and cons**

W/o KA: pros and cons

- Pro: Doses at interfaces inside the body are correct.
- Con: Doses near the surface of the body may be too small, because:
 - Material between the source and the person may produce secondary electrons, e.g. glasses in front of the eyes.
 - The calculated eye lens dose may be too small!
 - An operational quantity may seem to be conservative although it is not!

W/o KA: pros and cons

- Results with kerma approximation lead to similar values as in ICRP74

W/o KA: pros and cons

Recommendation to assess realistic dose values from fluence spectra

	<i>Approximate method A</i>	<i>Approximate method B</i>	<i>Accurate method</i>
<i>Contribution of secondary electrons produced outside the body</i>	negligible	significant	arbitrary
<i>Values recommended for use</i>	For photons: Values of this work	For $E_{\text{ph}} < 1$ MeV: Values of this work For $E_{\text{ph}} > 1$ MeV: Values of ICRP 74	For photons: Values of this work For electrons: Values of this eye model (Behrens et al. 2009 and Corrigendum) Add up both contributions
